

The Future We Build Together

Everyone in healthcare knows the pain points:

- **Credentialing** that drags on for months before a provider can even see patients.
- **Prior authorizations** that delay care and bury clinicians in faxes, calls, and portals.
- **Chart chases and audits** that waste time for both payers and providers.

These processes are universally agreed to be broken — but they persist because the infrastructure beneath healthcare is fragmented, siloed, and closed.

Prometheus Chains changes that by creating **open rails that anyone can build on:**

- **Shared foundation.** Once a patient-owned record and programmable payments exist, every other solution has a neutral, reliable starting point. Innovators don't have to rebuild basic plumbing every time — they can focus on solving real problems.
- **Composable by design.** Just like the early internet made it simple to build new apps on top of shared protocols, Prometheus Chains allows developers, researchers, and care organizations to stack new services on the same open rails.
- **Innovation without permission.** No vendor gatekeepers. No walled marketplaces. If an employer wants to spin up a wellness benefit, or a researcher wants to run a study that needs verified records, they can do it directly.
- **Infinite possibilities.** Imagine credentialing that takes seconds because medical schools, boards, and the DEA anchor records on chain. Imagine prior auth that runs automatically against published rules, without phone calls or forms. Imagine audits disappearing because proof is built in. And beyond that: direct-to-employer contracting, population health apps, global research collaborations — use cases limited only by imagination.

The result: The bottlenecks everyone hates today can vanish, and the space for new ideas explodes. With the fire back in our hands, healthcare becomes open, fair, and human.
