One Record. Every Clinic. Your Control.

Healthcare records today are fragmented across hospitals, clinics, labs, and payers. That's why every new provider asks for the same information and why patients rarely see their complete history in one place.

Prometheus Chains changes this by anchoring a **patient-owned record** that can connect to any system through existing, regulated pathways:

- **Your record lives with you.** Through a secure app on your phone, you can carry your entire medical history — labs, visits, medications, allergies — wherever you go.

- **Secured by Ethereum.** The record itself is encrypted and stored safely, with its integrity anchored on Ethereum. That means no one can alter or tamper with it, and only you can decide who sees it.

- **Sharing is simple and controlled.** When you visit a new doctor, you don't have to request records or wait weeks for transfers. You simply grant access through the app, sharing only what's needed for that visit.

- **Updates flow back to you.** After your appointment, the provider's new notes, labs, or updates are securely returned to you. You add them to your record, keeping your history complete and up to date.

- **Your record is recoverable.** Even if you lose your phone, your data remains safe. Because it's anchored and encrypted, only you can restore it — no one else can access it without your permission.

The result: a longitudinal record that finally works across every clinic and system, without replacing the EMRs providers already use. Patients stay in control, providers get accurate histories, and care becomes safer and more connected.
